

OPERATING SYSTEM: UNIX/LINUX

Course 1

Osman SALEM

Associate Professor - HDR

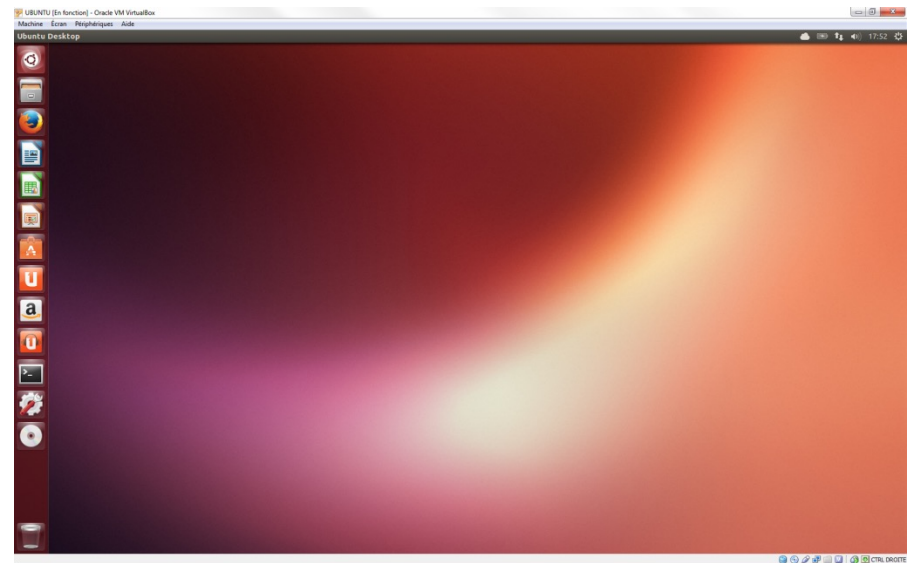

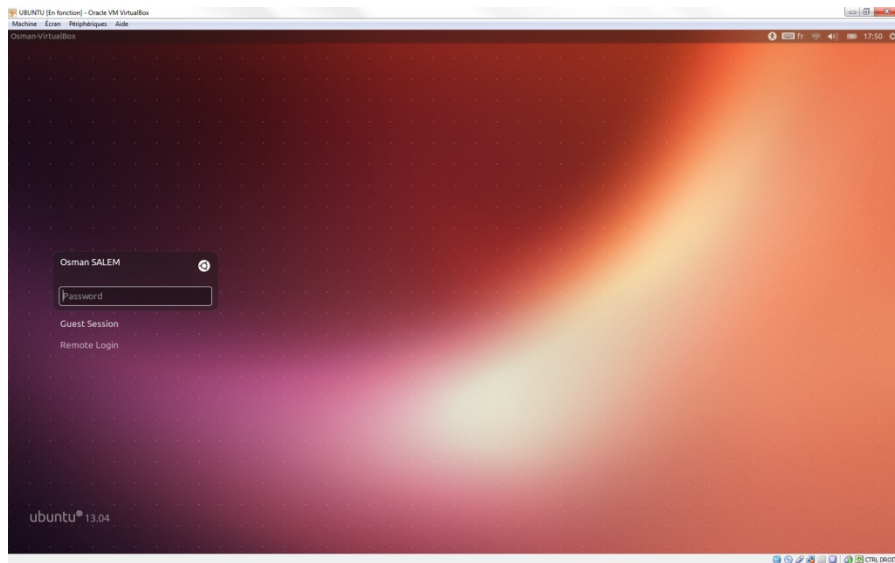

osman.salem@u-paris.fr

**Université
Paris Cité**

Ubuntu

- Ubuntu
- You will use your laptop
 - Install Virtualbox/Vmware workstation
 - Install Ubuntu

UNIX

- An operating system
- Developed at AT&T Bell Labs in the **1969**
- By **ken Thompson** and **Dennis Ritchie**
- Objective:
 - Portable OS written in C
 - Not in assembler
- Distributed as Open Source

The UNIX logo graphic consists of a yellow square, a blue square, and a red square, each with a black crosshair. The word "UNIX" is written in blue capital letters to the right of the yellow square.

UNIX

- Command Line Interpreter
- GUIs (Window systems) are now available
- Unix becomes commercial & paying (outside AT&T)

UNIX

- Unix is a multi-user, multi-tasking operating system
- You can have many users logged into a system simultaneously, each running many programs
- It's the kernel's job to keep each process and user separate and to regulate access to system hardware, including cpu, memory, disk and other I/O devices

History of UNIX

■ 1980

- Richard Stallman decides to create a clone of "Unix"
- With source code available (Open source)
- Creates Free software (most beautiful gift for the world!)
 - Open Source
 - You can look and modify the code
 - General Public License (GPL)
- Stallman want to create a derived version of "Unix"
 - GNU : GNU's Not Unix
 - Develop most of Unix Commands (GCC: C compiler)
- But they were late to develop the Kernel
 - Communications between software and hardware
 - Memory management, Process management, CPU usage, hard disk, network card, etc.

Richard Stallman

History of LINUX

- Linus Torvals in 1991
 - Has created the kernel using Minix
 - Publish in web forum
 - Like Free Software (General Public License)
 - Error in naming
 - Kernel : Linux à la place de Linus
 - Invite other to join his project
- Like kernel is the most important part
 - Linux + GNU = *Linux*
 - *Stallman* ask to call it: *GNU /Linux*
 - It's so late, because it was widely known as Linux
 - Kernel version: "x.y.z"
 - if "y" is even => stable version
 - If "y" is odd=> development version (under progress and unstable)
 - `$uname -r` => 3.8.0-19-generic
 - `$cat /etc/lsb-release`: ubuntu version, independent of kernel version
 - `$lsb_release -a` et `cat /etc/issue`

Linus Torvalds

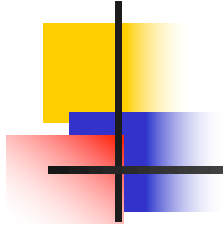

Unix vs. LINUX

- Unix was the predecessor of Linux
- Linux is a variant of Unix
 - So is Mac OS X, so much of this tutorial applies to Macs as well
 - Linux is open source
 - Linux is **free**
 - It's fully **customizable**
 - It's **stable** (i.e. it almost never crashes)
 - These characteristics make it an ideal OS for programmers and scientists

LINUX Distributions

- Mandrake: <http://www.mandrakesoft.com/>
- RedHat: <http://www.redhat.com/>
- Fedora: <http://www.fedora-fr.org/>
- CentOS : <http://www.centos.org/>
- Debian: <http://www.debian.org/> (very secure)
- Ubuntu: <http://www.ubuntu-fr.org/>
- SuSE/Novell: <http://www.suse.com/>
- etc.

Installation

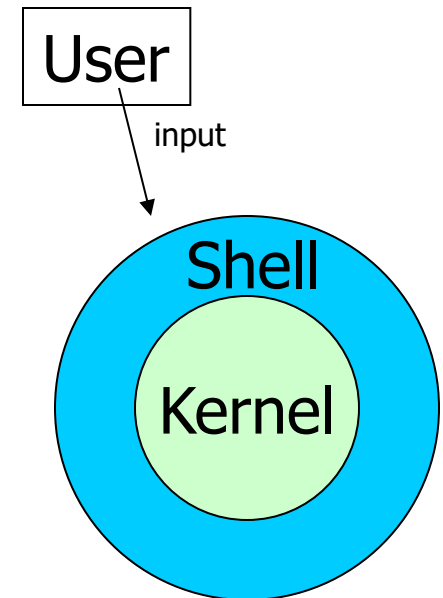

Installation

- Root password
- Network Devices
- Services
- Users
- Hardware

UNIX Structure

Shell

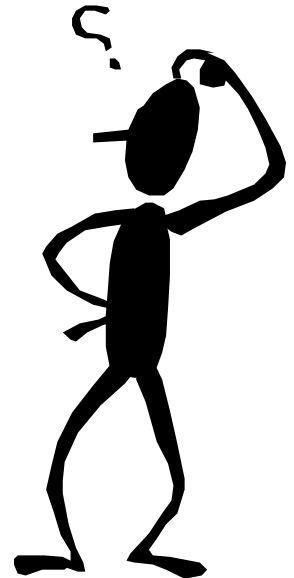

- Command line interpreter
- Shell is an interface between user and kernel
- Shell interprets your input as commands and pass them to kernel

Connecting to a Unix/Linux system

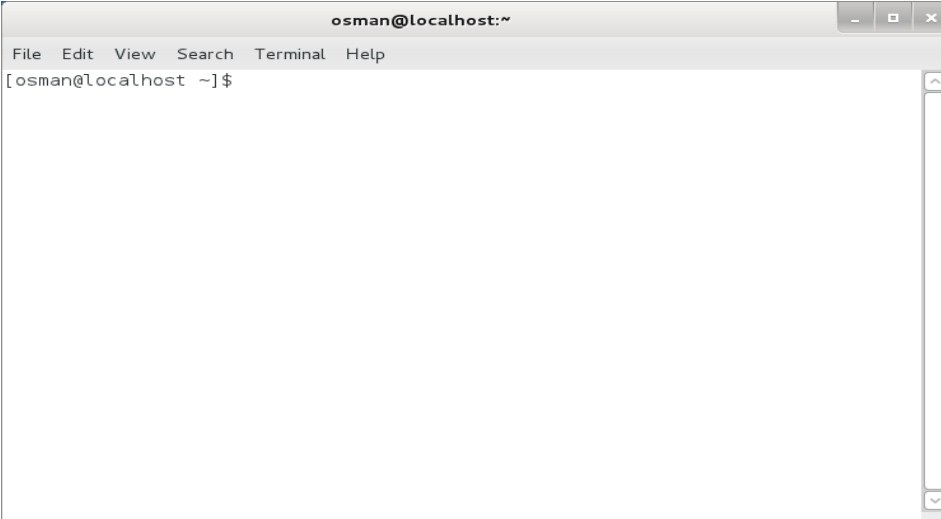

- **Attention:**
 - Linux is case **sensitive**
 - **file.txt** is different from ***FILE.txt***

*Really ! Why they
are different ?*

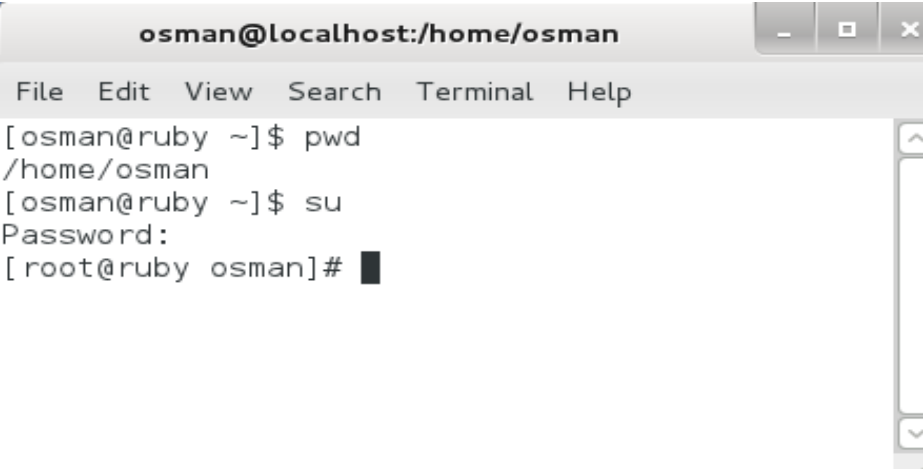

Terminal

- How to open a terminal ?

A screenshot of a terminal window titled "osman@localhost:~". The window has a menu bar with "File", "Edit", "View", "Search", "Terminal", and "Help". The terminal content shows the prompt "[osman@localhost ~]\$".

```
osman@localhost:~  
File Edit View Search Terminal Help  
[osman@localhost ~]$
```

A screenshot of a terminal window titled "osman@localhost:/home/osman". The window has a menu bar with "File", "Edit", "View", "Search", "Terminal", and "Help". The terminal content shows the user running "pwd" and "su" commands, resulting in a root shell.

```
osman@localhost:/home/osman  
File Edit View Search Terminal Help  
[osman@ruby ~]$ pwd  
/home/osman  
[osman@ruby ~]$ su  
Password:  
[root@ruby osman]#
```

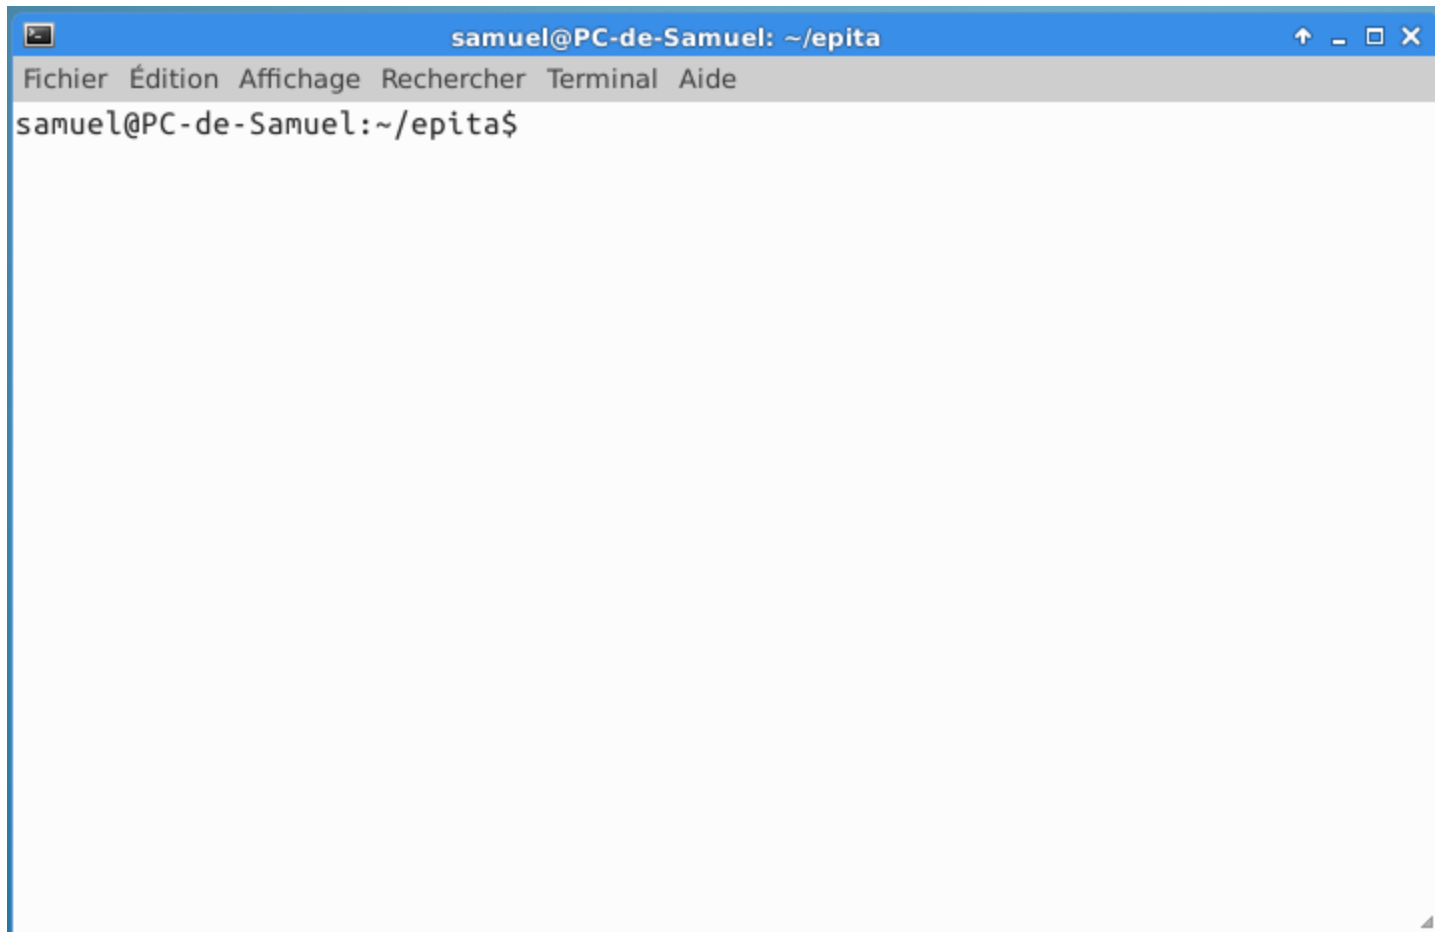

hostname

location in file system

user indicator, \$ = regular user

Connecting to a Unix/Linux system

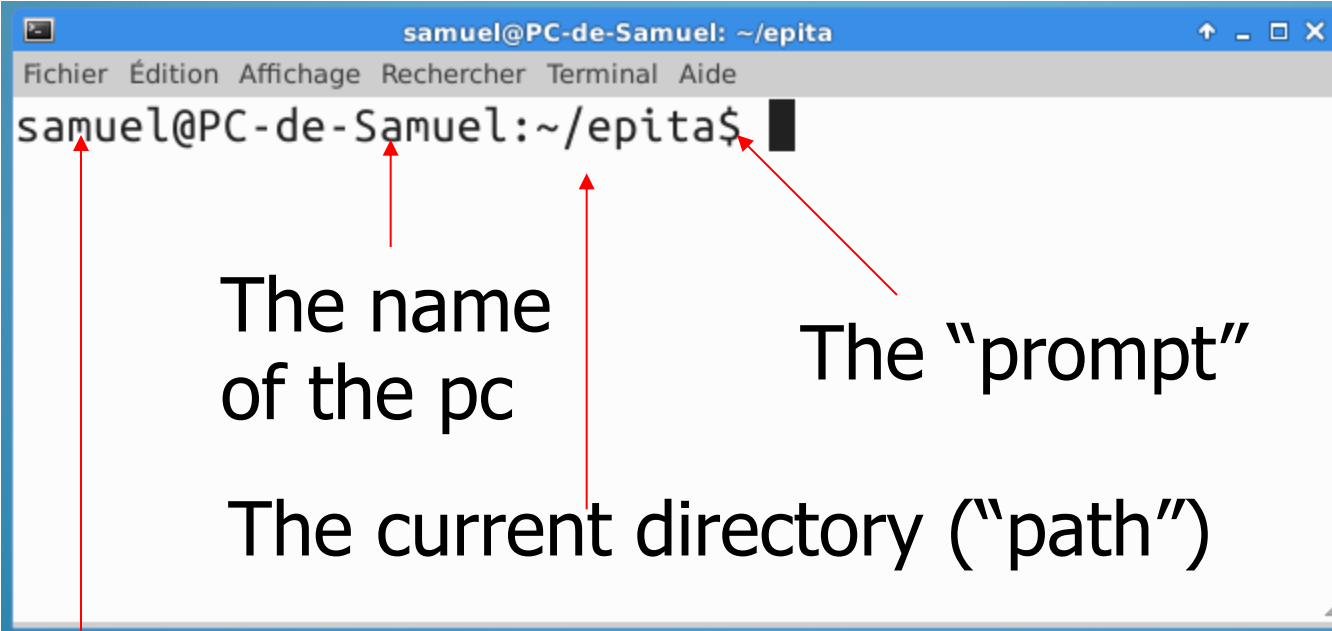

- Open up a terminal:

```
samuel@PC-de-Samuel: ~/epita
Fichier  Édition  Affichage  Rechercher  Terminal  Aide
samuel@PC-de-Samuel:~/epita$
```

Connecting to a Unix/Linux system

- Open up a terminal:

The screenshot shows a terminal window titled "samuel@PC-de-Samuel: ~/epita". The window has a menu bar with "Fichier", "Édition", "Affichage", "Rechercher", "Terminal", and "Aide". The command prompt is "samuel@PC-de-Samuel:~/epita\$". Four red arrows point from text labels to parts of the prompt: "The host" points to "samuel", "The name of the pc" points to "PC-de-Samuel", "The current directory ('path') points to "~/epita", and "The 'prompt'" points to "\$".

```
samuel@PC-de-Samuel: ~/epita
Fichier  Édition  Affichage  Rechercher  Terminal  Aide
samuel@PC-de-Samuel:~/epita$
```

The host

Shell commands

- ***Some commands***

- date
- who am i : account used
- who: list of connected users to the system
- cal: calender
- uname: OS & kernel version
- id: identity of user
- su: switch user
- script -a => exit: save in file name typescript
- file *filename*: the type of the file

Shell commands

- ***Some commands***

- date
- ls, cp, rm, mv, ln, pwd, cd, mkdir, find, cat, more, less, grep, sort, tail, head, wc, whereis, alias, unalias, type
- chgrp, df, file, tac, rev, tr, date, clear, diff, passwd, who, whoami
- Wildcards symbol: *, ?, []

Customize your shell

- ***# nano /home/login/.bashrc***
 - alias ll="ls | less"
 - alias x= "ls -l"
 - alias n= "nano"
- Restart your terminal
- Or
- *source .bashrc*

Help!

- Whenever you need help with a command type “man” and the command name
- The **man** command is used to display the manual entry associated with ***word*** entered as argument.
- The **-k** option is used to display a list of manual entries that contain entered ***keyword***.

man [chapter] *word*

man -k *keyword*

Help!

wiehe@zhome:~/linux_tutorial

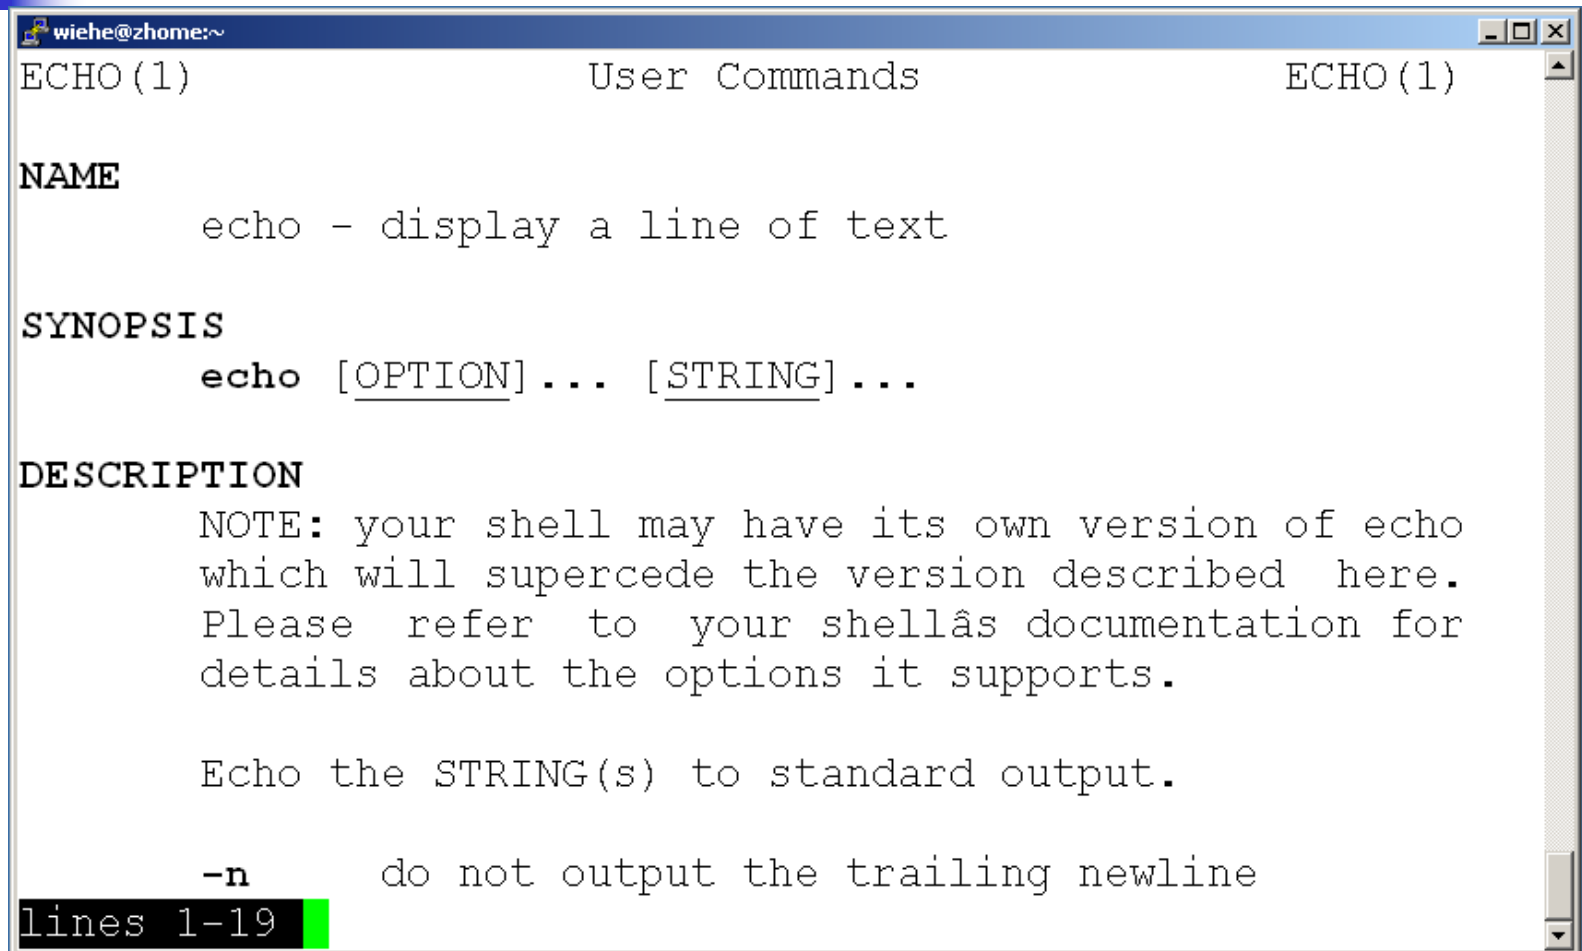

zhome:~/linux_tutorial\$ man

What manual page do you want?

zhome:~/linux_tutorial\$ man echo

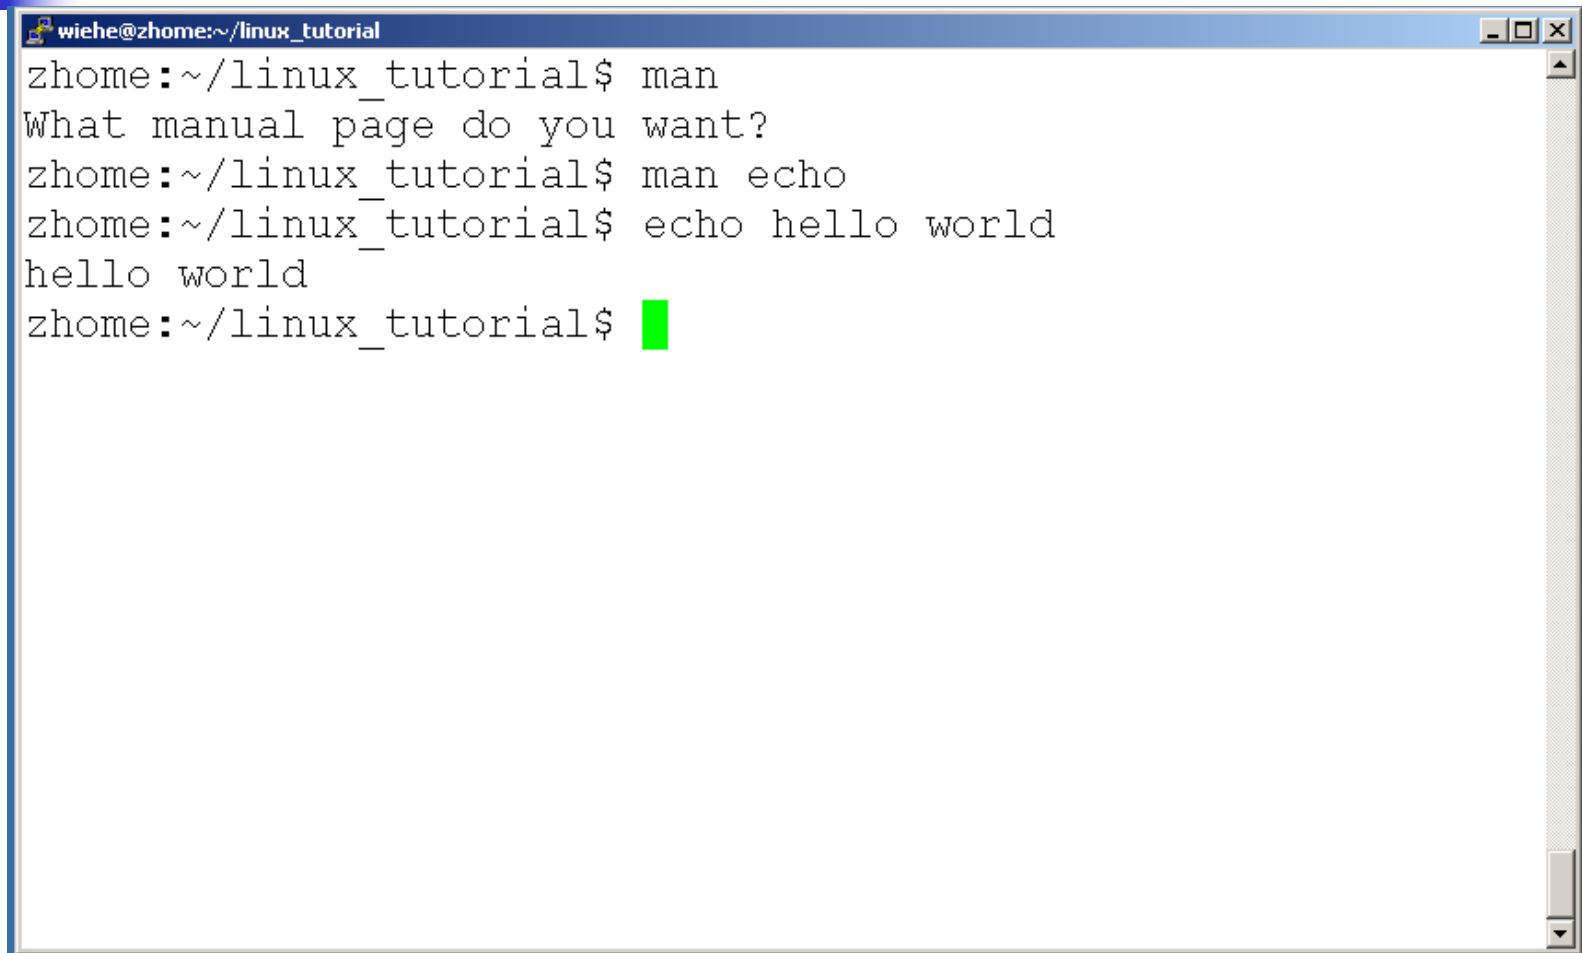

zhome:~/linux_tutorial\$ █

Help!

```
wiehe@zhome:~  
ECHO(1)                                User Commands                                ECHO(1)  
  
NAME  
    echo - display a line of text  
  
SYNOPSIS  
    echo [OPTION]... [STRING]...  
  
DESCRIPTION  
    NOTE: your shell may have its own version of echo  
    which will supercede the version described here.  
    Please refer to your shell's documentation for  
    details about the options it supports.  
  
    Echo the STRING(s) to standard output.  
  
    -n      do not output the trailing newline  
lines 1-19
```

Help!

```
wiehe@zhome:~/linux_tutorial
zhome:~/linux_tutorial$ man
What manual page do you want?
zhome:~/linux_tutorial$ man echo
zhome:~/linux_tutorial$ echo hello world
hello world
zhome:~/linux_tutorial$
```
