

\*Tags: [Variable Naming](#), [Assignment Operators](#), [Print](#)

## Intro

*#Variables* are like labels for values

- we can store a value and give it a name so that we can:
  - refer back to it later
  - use that value
  - change it later on

```
age = 104
age + 1
105

score = 500
score
500

score = score * 3
score
1500
```

## Variable Naming

- can't use name that is a Python keyword

```
help("keywords")
```

|   |   |   |
|---|---|---|
|  |  |  |
| variable123   | 123variable   | I O x   |
| first_name  | first name  | FirstName   |
| player_1  | False def   | FIRSTNAME   |

# Assignment Operators

## #Operators

- operator followed by an `=` sign
- changes variable to new value after equation

## Print() Function

### #Functions

prints out any values we pass to it to "standard output", it does not return anything

```
print("hello")
```

## Exercise - Magic Trick

```
#   __  __          _
#   |  \ /   |      (_)
#   | \ /   |  __ _  __ _
#   | |\ /   | / _` / _` |
#   | |  |   | (___) (___)
#   |_|  |   | \___) \___)
#
#               __/   |
```

```
# |___/

# Create a variable called secret_num and set it to any number you'd like:

secret_num = 13

# Increase secret_num by 1

secret_num += 1

# Next, take the new number and double it

secret_num *= 2

# Next, take the new number and add four to it

secret_num += 4

# Next, take the new number and divide by two

secret_num /= 2

# Next, take the new number and subtract your original secret number from it

secret_num -= 13

# Print the final result

print(secret_num)

# To see my magical prediction, scroll down...
