

NAME

CUTEST_ccfg_threaded – CUTEst tool to evaluate constraint functions values and possibly their gradients.

SYNOPSIS

CALL CUTEST_ccfg_threaded(status, n, m, X, C, jtrans, lj1, lj2, J_val, grad, thread)

For real rather than double precision arguments, instead

CALL CUTEST_ccfg_threaded_s(...)

and for quadruple precision arguments, when available,

CALL CUTEST_ccfg_threaded_q(...)

DESCRIPTION

The CUTEST_ccfg_threaded subroutine evaluates the values of the constraint functions of the problem decoded from a SIF file by the script *sifdecoder* at the point X , and possibly their gradients. The problem under consideration is to minimize or maximize an objective function $f(x)$ over all $x \in R^n$ subject to general equations $c_i(x) = 0$, ($i \in 1, \dots, m_E$), general inequalities $c_i^l \leq c_i(x) \leq c_i^u$ ($i \in m_E + 1, \dots, m$), and simple bounds $x^l \leq x \leq x^u$. The objective function is group-partially separable and all constraint functions are partially separable.

ARGUMENTS

The arguments of CUTEST_ccfg_threaded are as follows

status [out] - integer

the output status: 0 for a successful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error, 4 for an out-of-range thread,

n [in] - integer

the number of variables for the problem,

m [in] - integer

the total number of general constraints,

X [in] - real/double precision

an array which gives the current estimate of the solution of the problem,

C [out] - real/double precision

an array which gives the values of the general constraint functions evaluated at X . The i -th component of C will contain the value of $c_i(x)$,

jtrans [in] - logical

a logical variable which should be set `.TRUE.` if the transpose of the constraint Jacobian is required and `.FALSE.` if the Jacobian itself is wanted. The Jacobian matrix is the matrix whose i -th row is the gradient of the i -th constraint function,

lj1 [in] - integer

the actual declared size of the leading dimension of J_val (with $lj1$ no smaller than n if $jtrans$ is `.TRUE.` or m if $jtrans$ is `.FALSE.`),

lj2 [in] - integer

the actual declared size of the second dimension of J_val (with lj2 no smaller than m if jtrans is .TRUE. or n if jtrans is .FALSE.),

J_val [out] - real/double precision

a two-dimensional array of dimension (lj1, lj2) which gives the value of the Jacobian matrix of the constraint functions, or its transpose, evaluated at X. If jtrans is .TRUE., the i,j-th component of the array will contain the i-th derivative of the j-th constraint function. Otherwise, if jtrans is .FALSE., the i,j-th component of the array will contain the j-th derivative of the i-th constraint function,

grad [in] - logical

a logical variable which should be set .TRUE. if the gradient of the constraint functions are required and .FALSE. otherwise,

thread [in] - integer

thread chosen for the evaluation; threads are numbered from 1 to the value threads set when calling CUTEst_csetup_threaded.
