

NAME

CUTEST_cjprod – CUTEst tool to form the matrix-vector product of a vector with the Jacobian of the constraints, or its transpose.

SYNOPSIS

CALL CUTEST_cjprod(status, n, m, gotj, jtrans, X, VECTOR, lvector, RESULT, lresult)

For real rather than double precision arguments, instead

CALL CUTEST_cjprod_s(...)

and for quadruple precision arguments, when available,

CALL CUTEST_cjprod_q(...)

DESCRIPTION

The CUTEST_cjprod subroutine forms the product of a vector with the Jacobian matrix, or with its transpose, of the constraint functions of the problem decoded from a SIF file by the *scriptsifdecoder* evaluated at the point X.

The problem under consideration is to minimize or maximize an objective function $f(x)$ over all $x \in R^n$ subject to general equations $c_i(x) = 0$, ($i \in 1, \dots, m_E$), general inequalities $c_i^l \leq c_i(x) \leq c_i^u$ ($i \in m_E + 1, \dots, m$), and simple bounds $x^l \leq x \leq x^u$. The objective function is group-partially separable and all constraint functions are partially separable.

ARGUMENTS

The arguments of CUTEST_cjprod are as follows

status [out] - integer

the output status: 0 for a successful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error,

n [in] - integer

the number of variables for the problem,

m [in] - integer

the total number of general constraints,

gotj [in] - logical

a logical variable which specifies whether the first derivatives of the groups and elements have already been set (gotj = .TRUE.) or if they should be computed (gotj = .FALSE.),

jtrans [in] - logical

a logical variable which specifies whether the product should involve the Jacobian (jtrans = .FALSE.) or its transpose (jtrans = .TRUE.),

X [in] - real/double precision

when gotj = .FALSE., the derivatives will be evaluated at X. Otherwise X is not used,

VECTOR [in] - real/double precision

an array which gives the vector whose product with the Jacobian or its transpose is required,

lvector [in] - integer

the actual declared dimension of VECTOR.

RESULT [out] - real/double precision

an array which gives the result of multiplying the Jacobian or its transpose by VECTOR.

lresult [in] - integer

the actual declared dimension of RESULT.

NOTE

gotj should be set to .TRUE. whenever

(1)

a call has been made to CUTEST_cgr, CUTEST_csgr, CUTEST_cgrrh, CUTEST_csgreh or CUTEST_csgrsh at the current point, or

(2)

a previous call to CUTEST_cjprod, with gotj = .FALSE., at the current point has been made.

Otherwise, it should be set .FALSE.
