NAME

CUTEST_csgrp − CUTEst tool to evaluate the sparsity pattern of the constraints gradients and gradient of objective/Lagrangian function.

SYNOPSIS

CALL CUTEST_csgrp(status, n, nnzj, lj, J_var, J_fun)

For real rather than double precision arguments, instead

CALL CUTEST_csgrp_s(...)

and for quadruple precision arguments, when available,

CALL CUTEST_csgrp_q(...)

DESCRIPTION

The CUTEST_csgrp subroutine evaluates the sparsity pattern used when storing the gradients of the general constraints and of either the objective function or the Lagrangian function $l(x, y) = f(x) + y^T c(x)$ corresponding to the problem decoded from a SIF file by the script *sifdecoder*.

The problem under consideration is to minimize or maximize an objective function $f(x)$ over all $x \in R^n$ subject to general equations $c_i(x) = 0$, $(i \in 1, \ldots, m_E)$, general inequalities $c_i^l \leq c_i(x) \leq c_i^{u,}$ $(i \in m_E + 1, \ldots, m)$, and simple bounds $x^l \leq x \leq x^{u.}$ The objective function is group-partially separable and all constraint functions are partially separable.

ARGUMENTS

The arguments of CUTEST_csgrp are as follows

status [out] - integer
the outputr status: 0 for a succesful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error,

n [in] - integer
the number of variables for the problem,

nnzj [out] - integer
the number of nonzeros in J_var and J_fun,

lj [in] - integer
the actual declared dimensions of J_var and J_fun,

J_var [out] - integer
an array whose i-th component is the index of the variable with respect to which the derivative is taken,

J_fun [out] - integer
an array whose i-th component is the index of the problem function whose derivative is taken. J_fun(i) = 0 indicates the objective or Lagrangian function, while J_fun(i) = j > 0 indicates the j-th general constraint function.
