INDEX

S.No.	Particulars	Pages
1.	WAP to find factorial of a given number using recursion.	3
2.	WAP to find reverse of a given number.	
3.	WAP to input name, rollno. & age of 3 students using a structure & displays them.	
4.	WAP to show swapping of 2 nos. using call by value method.	
5.	WAP to show swapping of 2 nos. using reference method.	
6.	WAP to show overloading of area function.	
7.	WAP to find largest no. of 5 nos. from an array.	
8.	WAP to show working of static variable using a function.	
9.	WAP to create a class employee having data members empid, empname, age; use member functions getdata() & displaydata() to read & display the data. Keep data members as private.	
10.	WAP create a class student take public data members rollno, name & age and enter these data from main function.	
11.	WAP to show working of parameterized constructor.	
12.	WAP to copy value of 2 parameters from one constructor to another using copy constructor.	
13.	WAP to implementing an array of objects in a class using member functions to input & display data.	
14.	WAP to print sum of elements above the diagonal elements in a matrix of 3*3 elements.	
15.	WAP to show one class students having data member rollno, name & age. Inherits some features of teacher, when inherited publically.	
16.	WAP for implementing multiple inheritance concept using classes.	
17.	WAP to overload a binary operator '+' to add two values using objects.	
18.	WAP showing implementation of a nested structure & access the data members of both structures.	
19.	WAP to read & write file objects using read & write functions from the file.	
20.	WAP to implement template class using function.	
21.	WAP to create a friend function & use it to access public & private dates members of class.	

NOTE: All the codes inside this file is written in Visual Studio Code v1.62.0 with MinGW GCC-6.3.0-1 on Windows 11 OS

// 1. WAP to find factorial of a given number using recursion.

```
                                //Factorial of a Number Using Recursion
#include<iostream>

using namespace std;

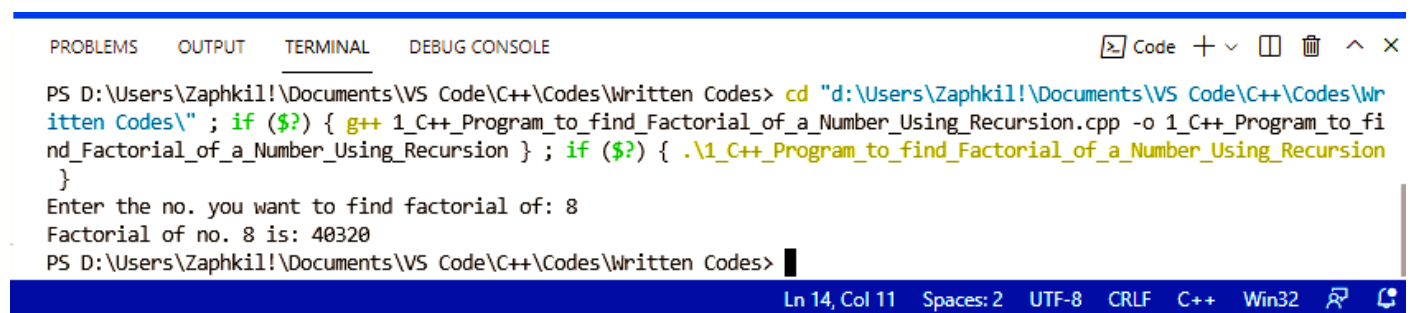

int find_factorial(int n)
{
    if (n>=1)
        return n*find_factorial(n-1);
    else
        return 1;
}

int main()
{
    int input_no;// factorial=0;

    cout <<"Enter the no. you want to find factorial of: ";
    cin >>input_no;
    find_factorial(input_no);

    cout <<"Factorial of no. "<< input_no <<" is: "<<find_factorial(input_no);
}
```

OUTPUT

The screenshot shows a Visual Studio Code interface with a terminal window open. The terminal displays the command prompt, the execution of a C++ program, and the output. The program prompts the user to enter a number, and the user enters 8. The program then outputs the factorial of 8, which is 40320.

```

}
```

OUTPUT

The screenshot shows a Visual Studio Code interface with a terminal window open. The terminal displays the output of a C++ program. The program prompts the user to enter a number, and the user enters 456. The program then calculates the reverse of 456, which is 654, and displays it. The terminal window has tabs for PROBLEMS, OUTPUT, TERMINAL, and DEBUG CONSOLE. The TERMINAL tab is active. The status bar at the bottom shows the current line and column (Ln 8, Col 45), the number of spaces (Spaces: 2), the encoding (UTF-8), the line ending (CRLF), the language (C++), and the window title (Win32).
