Shell script throws a not found error when run from a sh file. But if entered manually the commands work

I'm trying to use the following script to generate a sitemap for my website. When I run it as `sh thsitemap.sh` I get an error like this and creates an empty sitemap.xml file:

```
thsitemap.sh: 22: thsitemap.sh: [: not found
thsitemap.sh: 42: thsitemap.sh: [: not found
thsitemap.sh: 50: thsitemap.sh: Syntax error: "(" unexpected
```

But as the same user `root` when I manually copy and paste these lines on the terminal, it works without any error and the sitemap.xml file have all the urls. What's the problem? How can I fix this?

```
#!/bin/bash
